unidirectional cDNA library generated from [Root tips
unidirectional cDNA library generated from [Root tips
(0.3cm-long) from adult plants]. cDNA was prepared from
polyst mRNA using SuperScript Plasmid System Kit
(Invitrogen). The double-strand cDNAs were fractionated
in a sepharose CL-2B 40cm-columns and fragments sizing
between 0.8 and 1.5 Kb were directionally cloned into the
vector. Details of each source of RNA and library
construction can be obtained at
http://sucest.lad.ic.unicamp.br/public"

/note="Organ: leaf; Vector: RescueMu (engineered from pBlueScript backbone); Site 1: BamHI; Site 2: BgJII;
RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb iastate.edu' and follow the links for 'RescueMu.' Grid Lwas grown in Molokai in 2001. DNA was extracted from leaf strips, double digested using BamHI and BgIII, and ligated to form circular plasmids. DHIOB cells were transformed and then screened on LB plates with ampicillin."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CA202412 671 bp mRNA linear EST 25-SEP-2003 SCREFL1009H02.g FL1 Saccharum officinarum cDNA clone SCRLFL1009H02 5', mRNA sequence.

Submitted (15-ARR-2002) Maize Mapping Project, University of Missouri, Columbia, MO 65211, USA
If you are interested in getting corresponding physical clones, these are publicly available from ZMDB and may be found by BLAST searching at MSL, maizemap.org; ZmDB, www.radb.isatate.edu; TIGR, www.tigr.org; or NCBI, www.ncbi.nlm.nih.gov. When the source of the maize cDNA sequences is either Virginia Walbot, Stanford or Pat Schnable, Iowa State, then clones may be requested from ZmDB: www.zmdb.isatate.edu.

An unidirectional cDNA library generated from
[Inflorescence at begining of development (Icm-long)].
cDNA was prepared from poly4+ mRNA using SuperScript
Plasmid System Kit (Invitrogen). The double-strand cDNAs
were fractionated in a sepharose CL-28 40cm-columns and
fragments sizing between 0,8 and 1.5 KD were
directionally cloned into the vector. Details of each
source of RNA and library construction can be obtained at

CDNA was prepared from poly4+ mRNA using SuperScript Plasmid System Kit (Invitrogen). The double-strand cDNAs were fractionated in a sepharose CL-2B 40cm-columns and fragments sizing between 0.8 and 1.5 Kb were directionally cloned into the vector. Details of each source of RNA and library construction can be obtained at
                                                                                                                                                                                                                                                                                         245

/Glone lib="Triticum aestivum FGAS: Library 6 Crown
(50%) and leaf (50%) tissues from wheat cultivar Norstear
after short exposure times to low temperature in the light
and in the dark. 12 mRNA populations were combined before
constructing the library. The first 6 populations: After 7
days of growth at 20Cs from wheat cultivar Norstear after
short exposure times to low temperature in the light and
in the dark. 12 mRNA populations were combined before
constructing the library. The first 6 populations: After 7
days of growth at 20, wheat plants were transferred to 4C
in the light. 1cm crown sections and green leaf tissu were
separately harvested after 1, 3, and 6 hours of low
temperature exposure. The last 6 populations: After 7
of growth at 20C, wheat plants were transferred to 4C in
the dark. 1cm crown sections and green leaf tissu were
separately harvested after 1, 3, and 6 hours of low
temperature exposure. First strand synthesis in this
library was done in the presence of methylaced dcTP
thereby protecting from internal cleavage with Not! In
addition, this library used a primer for second strand
synthesis that annealed to an artificial sequence (RNA)
of icn addition, adach therefore when a primer for second strand
synthesis that annealed to an artificial sequence (RNA)

This sequence is the direct result of the Base calling software
Phris sequence is the direct result of the Base calls. To aid in the
identification of the high quality insert the software Lucy
(default parameters) has been run on this sequence. Lucy identified
the region [1,797].
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     oligo) added before first strand synthesis. Therefore when sequences from BST generated from this library will be masked for vector and adaptor sequences, an additional masking srep will have to be included to mask this RNA oligo that is common to all clones (sequence

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 4634, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:
APPLICANT: VENTER, J. Craig et al.
TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED
TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;
FILE REPERENCE: CLOON 1307
CURRENT APPLICATION NUMBER: US/09/949,016
CURRENT FILING DATE: 2000-04-14
PRIOR FILING DATE: 2000-10-20
PRIOR FILING DATE: 2000-10-03
PRIOR FILING DATE: 2000-10-03
PRIOR FILING DATE: 2000-10-03
PRIOR FILING DATE: 2000-10-03
SPIOR RELING DATE: 2000-10-03
SOUTHARE: FREESEQ for Windows Version 4.0
SEQ ID NO 4634
LENGTH: 1781

The invention relates to novel inositol polyphosphate kinase (IPPK) polypeptides and polymucleotides. Sequences of the invention are useful in modulating the phytic acid biosynthesis by decreasing phytate and/ or increasing non-phytate phosphorous to improve the nutritional value of animal feed, or to reduce the environmental impact of animal waste. Polymucleotides of the invention are to produce transgenic plants with an altered phenotype. IPPK proteins are used to screen compounds that modulate their activity and raising anti-idiotypic antibodies. The present sequence is maize IPPK DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel inositol polyphosphate kinase (IPPK) polypeptides and polynucleotides. Sequences of the invention are useful in modulating the phytic acid biosynthesis by decreasing phytate and/ or increasing non-phytate phosphorous to improve the nutritional value of animal feed, or to reduce the environmental impact of animal waste. Polynucleotides of the invention are to produce transgenic plants with an altered phenotype. IPPK proteins are used to screen compounds that modulate their activity and raising anti-idiotypic antibodies. The

of

phytic acid;

```
The invention relates to novel inositol polyphosphate kinase (IPPK) polypeptides and polynucleotides. Sequences of the invention are useful in modulating the phytic acid biosynthesis by decreasing phytate and/ or increasing non-phytate phosphorous to improve the nutritional value of animal feed, or to reduce the environmental impact of animal waste. Polynucleotides of the invention are to produce transgenic plants with an altered phenotype. IPPK proteins are used to screen compounds that modulate thair activity and raising anti-idiotypic antibodies. The present sequence is maize IPPK DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               41 GlyGluHisGluValAlaPheTyrGluAlaPheSerAlaHisAlaAlaValProAlaArg 60
